NovaFlex Tooling Guidelines

Applies to: NovaFlex MultiPurpose Adhesive/Sealant (MX), NovaFlex Metal Roof Adhesive Sealant (MR), NovaFlex Gutter Sealant (GS)

Proper Tooling technique:

To further assure the sealant has achieved complete contact and full 'wetting' between the surfaces being bonded, run a concave tool or your finger along the length of the bead with a controlled, consistent pressure. When sealing corners, the sealant should end up with a slightly concave shape. When sealing flat seams or cracks, you should smooth down and feather out the bead, so water will run off it and not pool or stand on the caulk.

Issue Date: March 11, 2021
